ABSTRACT

Phenomena such as simulation, virtual reality, artificial intelligence, digital transformation, wearable technology, smart robots, microchip, 5G, quantum computers, robotics, bionics pose serious threats to the individual and society. Current developments have made it difficult for us to distinguish between the virtual and the real and have opened the physical reality for discussion in the virtual community. With the introduction of digital tools into our lives, the individual's connection with the outside world has been severed and relations have moved to the virtual world. Recent developments allow the individual to reconnect with physical reality and engage in physical activities in the digital world. In the modern society, the individual was able to participate in virtual communities on the one hand and maintain his relationship with the traditional community on the other. The individual who is isolated in the virtual society, finds the opportunity to socialize again by breaking his ties with the land in the digital age. Relationships between humans and robots have become commonplace today: Robot marriage, robot dog, robot child, robot assistant... In the digital society, interpersonal relationships are being replaced by robotic relationships. Those who argue that robots should have legal rights like humans, bring up the "Robot Law". In this study, "is physical reality possible in virtual communities" the answer to the question was sought and the data obtained from the literature review were evaluated from a sociological perspective. Research data, the latest stage of technology and the developments in the digital world have shown that physical reality is possible in the virtual world and this will be the scene of new types of social relations.
